Minimun requirements:

8 Bit Adam:

- 17.4GB of VRAM
- 12.5GB of RAM

8 Bit Adam and FP16:

- 19GB of VRAM
- 8GB of RAM

Instructions:

Execute the following:

```
git clone https://github.com/chavinlo/distributed-diffusion
cd distributed-diffusion
pip install -r requirements.txt
```

Download your dataset and put it in a folder. It must be in the following format:

```
mydataset
├── image0.jpg
├── image0.txt
├── image1.jpg
└── image1.txt
```

Due to a bug that limits the filename length in the trainer, we need to sanitize it to only use less than 7 characters:

```
python3 utils/curatedata.py --dataset mydataset
```

Change "mydataset" for the name of your dataset folder.

The model to train on top of has to be in diffusers format. The CKPT to Diffusers script is included in utils folder:

```
python3 utils/convert_original_stable_diffusion_to_diffusers.py --checkpoint_path mycheckpoint.ckpt --dump_path diffuser
```

Change "mycheckpoint.ckpt" to the name of the model CKPT file to convert, and "diffuser" to the name of the folder where you want the new converted diffuser model to be at.

In order to start training execute the following command:

```
python3 finetune.py --model diffuser --dataset mydataset --run_name mytrainedmodel --use_8bit_adam
```

This command will:

- Use the folder "diffuser" as the base diffuser model to train on top of
- Use the folder "mydataset" as the training data
- Name the new model "mytrainedmodel"
- Use 8-bit Adam Optimizer

Of course you can change any of those parameters to your liking.
Once training finishes, your trained model will be available in the "output" folder.

You can see what other parameters are available at https://github.com/chavinlo/distributed-diffusion/blob/1aed72e775edaaf3d02ab2d31f870a5f9e4c1635/finetune.py#L36

You can also do distributed training, but such feature is under alpha testing and does not work correctly yet. Check the repository for more information: https://github.com/chavinlo/distributed-diffusion

How long will this take?

It depends on what GPU you are using. But what is indeed a fact is that it is going to be much faster than the previous trainer.
Some experiments ran on A100-80GB-XM4
ETA is for 75K Images/10 Epochs/750K Itterations. In other words, analyzing 750,000 Images.
Loaded via directories

8 Bit Adam only, Batch size 1, lr 5e-6:

- It/s: Min. 2.60; Max. 3.20; Avg. 3.05
- ETA: Around 70 Hours
- 17.4GB of VRAM
- 12.5GB of RAM

8 Bit Adam only, Batch size 4, lr 5e-6:

- It/s: Min. 1.02; Max. 1.26; Avg. 1.15
- ETA: Around 47 Hours
- 37GB of VRAM
- 11.2GB of RAM

8 Bit Adam only, Batch size 8, lr 5e-6:

- s/it: Min. 1.39; Max. 2.16; Avg. 1.40
- ETA: Around 40 Hours
- 63GB of VRAM
- 11.2GB of RAM
